Getting started

To program in C# you will need a text editor and a compiler, you can use whatever you want, but I highly recommend Visual Studio: it's both a text editor and a compiler, it has amazing features that help you writing and debugging the code and it's free.

You can download it here: https://www.microsoft.com/it-it/download/details.aspx?id=48146

In the installation make sure to install all the c# packages

Take your time, I can wait...

Done? Great so run Visual Studio, click that "New Project..." button and choose the Visual C# Console Application template.
